Pearson Edexcel International A Level
In Pure Mathematics P4 (WMA14) Paper 01

Edexcel and BTEC Qualifications

Edexcel and BTEC qualifications are awarded by Pearson, the UK's largest awarding body. We provide a wide range of qualifications including academic, vocational, occupational and specific programmes for employers. For further information visit our qualifications websites at www.edexcel.com or www.btec.co.uk. Alternatively, you can get in touch with us using the details on our contact us page at www.edexcel.com/contactus.

Pearson: helping people progress, everywhere

Pearson aspires to be the world's leading learning company. Our aim is to help everyone progress in their lives through education. We believe in every kind of learning, for all kinds of people, wherever they are in the world. We've been involved in education for over 150 years, and by working across 70 countries, in 100 languages, we have built an international reputation for our commitment to high standards and raising achievement through innovation in education. Find out more about how we can help you and your students at: www.pearson.com/uk

General Marking Guidance

- All candidates must receive the same treatment. Examiners must mark the first candidate in exactly the same way as they mark the last.
- Mark schemes should be applied positively. Candidates must be rewarded for what they have shown they can do rather than penalised for omissions.
- Examiners should mark according to the mark scheme not according to their perception of where the grade boundaries may lie.
- There is no ceiling on achievement. All marks on the mark scheme should be used appropriately.
- All the marks on the mark scheme are designed to be awarded. Examiners should always award full marks if deserved, i.e. if the answer matches the mark scheme. Examiners should also be prepared to award zero marks if the candidate's response is not worthy of credit according to the mark scheme.
- Where some judgement is required, mark schemes will provide the principles by which marks will be awarded and exemplification may be limited.
- When examiners are in doubt regarding the application of the mark scheme to a candidate's response, the team leader must be consulted.
- Crossed out work should be marked UNLESS the candidate has replaced it with an alternative response.

General Instructions for Marking

1. The total number of marks for the paper is 75. /
2. The Pearson Mathematics mark schemes use the following types of marks:
 - **M** marks: Method marks are awarded for ‘knowing a method and attempting to apply it’, unless otherwise indicated.
 - **A** marks: Accuracy marks can only be awarded if the relevant method (M) marks have been earned.
 - **B** marks are unconditional accuracy marks (independent of M marks)
 - Marks should not be subdivided.

3. Abbreviations

These are some of the traditional marking abbreviations that will appear in the mark schemes and can be used if you are using the annotation facility on ePEN.

- bod – benefit of doubt
 - ft – follow through
 - the symbol \surd or ft will be used for correct ft
 - cao – correct answer only
 - cso - correct solution only. There must be no errors in this part of the question to obtain this mark
 - isw – ignore subsequent working
 - awrt – answers which round to
 - SC: special case
 - oe – or equivalent (and appropriate)
 - d... or dep – dependent
 - indep – independent
 - dp decimal places
 - sf significant figures
 - * The answer is printed on the paper or ag- answer given
 - \square or d... The second mark is dependent on gaining the first mark
4. All A marks are ‘correct answer only’ (cao.), unless shown, for example, as A1 ft to indicate that previous wrong working is to be followed through. After a misread however, the subsequent A marks affected are treated as A ft, but manifestly absurd answers should never be awarded A marks.

5. For misreading which does not alter the character of a question or materially simplify it, deduct two from any A or B marks gained, in that part of the question affected. If you are using the annotation facility on ePEN, indicate this action by 'MR' in the body of the script. /
6. If a candidate makes more than one attempt at any question:
 - If all but one attempt is crossed out, mark the attempt which is NOT crossed out.
 - If either all attempts are crossed out or none are crossed out, mark all the attempts and score the highest single attempt.
7. Ignore wrong working or incorrect statements following a correct answer.

General Principles for Core Mathematics Marking

(But note that specific mark schemes may sometimes override these general principles).

Method mark for solving 3 term quadratic:

1. Factorisation

$(x^2 + bx + c) = (x + p)(x + q)$, where $|pq| = |c|$, leading to $x = \dots$

$(ax^2 + bx + c) = (mx + p)(nx + q)$, where $|pq| = |c|$ and $|mn| = |a|$, leading to $x = \dots$

2. Formula

Attempt to use the correct formula (with values for a, b and c).

3. Completing the square

Solving $x^2 + bx + c = 0$: $\left(x \pm \frac{b}{2}\right)^2 \pm q \pm c = 0$, $q \neq 0$, leading to $x = \dots$

Method marks for differentiation and integration:

1. Differentiation

Power of at least one term decreased by 1. ($x^n \rightarrow x^{n-1}$)

2. Integration

Power of at least one term increased by 1. ($x^n \rightarrow x^{n+1}$)

Use of a formula

Where a method involves using a formula that has been learnt, the advice given in recent examiners' reports is that the formula should be quoted first.

Normal marking procedure is as follows:

Method mark for quoting a correct formula and attempting to use it, even if there are small errors in the substitution of values.

Where the formula is not quoted, the method mark can be gained by implication from correct working with values but may be lost if there is any mistake in the working.

Exact answers

Examiners' reports have emphasised that where, for example, an exact answer is asked for, or working with surds is clearly required, marks will normally be lost if the candidate resorts to using rounded decimals.

Question Number	Scheme	Marks
1	Attempt at chain rule $y^2 \rightarrow \dots y \frac{dy}{dx}$	M1
	Attempt at product rule $3x^2 y \rightarrow \dots x^2 \frac{dy}{dx} + \dots xy$	M1
	Correct differentiation $2 - 8y \frac{dy}{dx} + 6xy + 3x^2 \frac{dy}{dx} = 8x$	A1
	Substitutes $x = 3, y = 2 \Rightarrow \frac{dy}{dx} = -\frac{14}{11}$	M1, A1
	Correct method for normal at $(3, 2) \Rightarrow y - 2 = \frac{11}{14}(x - 3)$ $11x - 14y - 5 = 0$	dM1 A1
		(7) (7 marks)

M1: Attempts at chain rule $y^2 \rightarrow \dots y \frac{dy}{dx}$ where ... is a constant

M1: Attempt at product rule $3x^2 y \rightarrow \dots x^2 \frac{dy}{dx} + \dots xy$ where ... are constants

A1: Correct differentiation $2x - 4y^2 + 3x^2 y = 4x^2 + 8 \rightarrow 2 - 8y \frac{dy}{dx} + 6xy + 3x^2 \frac{dy}{dx} = 8x$ o.e.

You may see $2x - 4y^2 + 3x^2 y = 4x^2 + 8 \rightarrow 2dx - 8ydy + 6xydx + 3x^2 dy = 8x dx$ o.e. which is fine

Note that $\frac{dy}{dx} = 2 - 8y \frac{dy}{dx} + 6xy + 3x^2 \frac{dy}{dx} - 8x$ is A0 unless recovered

M1: Substitutes $x = 3, y = 2$ into a suitable equation and finds a value for $\frac{dy}{dx}$.

It is dependent upon having exactly two $\frac{dy}{dx}$ terms, one from differentiating each of y^2 and $x^2 y$

A1: $\frac{dy}{dx} = -\frac{14}{11}$ o.e.

dM1: Dependent upon the previous M. It is for a correct method of finding the equation of

the normal at $(3, 2)$. Look for $y - 2 = \frac{11}{14}(x - 3)$ with the negative reciprocal of

their $-\frac{14}{11}$ being used.

If the form $y = mx + c$ is used they must proceed as far as $c = \dots$

A1: $11x - 14y - 5 = 0$ but accept any integer multiple of this. The "= 0" must be seen

Question Number	Scheme	
2	$\frac{dy}{dx} = \frac{4y^2}{\sqrt{4x+5}} \Rightarrow \int \frac{1}{y^2} dy = \int \frac{4}{\sqrt{4x+5}} dx$ $-\frac{1}{y} = 2\sqrt{4x+5} (+c)$ <p>Substitutes $y = \frac{1}{3}, x = -\frac{1}{4} \Rightarrow -3 = 4 + c \Rightarrow c = \dots$ Marks</p> <p>Rearranges $\frac{a}{y} = b\sqrt{4x+5} + c$ to $y = \dots$</p> $y = \frac{1}{7 - 2\sqrt{4x+5}}$	B1 M1, A1 dM1 ddM1 A1 <p style="text-align: right;">(6) (6 marks)</p>

B1: Separates the variables. Note that the "4" may be on either side but must be in the correct place
 The dy and dx **must** be present **and** in the correct place. Condone missing integral signs

M1: Integrates one side to a correct form. No requirement for $+c$

Look for $\int \frac{1}{y^2} dy \rightarrow \frac{a}{y}$ or $\int \frac{1}{\sqrt{4x+5}} dx \rightarrow k\sqrt{4x+5}$ or equivalent

A1: Correct integration for both sides. Allow unsimplified but there is no requirement for $+c$

Look for $-\frac{1}{y} = 2\sqrt{4x+5}$ or equivalent such as $-\frac{1}{4y} = \frac{\sqrt{4x+5}}{4 \times \frac{1}{2}}$

dM1: Substitutes $y = \frac{1}{3}, x = -\frac{1}{4}$ into their integrated form to find a value for c

It is dependent upon having integrated one side to a correct form.
 Condone this being done following poor re-arrangement

ddM1: Rearranges $\frac{a}{y} = b\sqrt{4x+5} + c$ to $y = \dots$ using a correct method. Do not allow each term to be inverted.

It is dependent upon

- integrating BOTH sides to a correct form
- substituting $y = \frac{1}{3}, x = -\frac{1}{4}$ into the correct integrated form to find a value for c
- rearranging $\frac{a}{y} = b\sqrt{4x+5} + c$ to $y = \dots$ using a correct method but condone sign slips

A1: $y = \frac{1}{7 - 2\sqrt{4x+5}}$ or exact equivalent. E.g. $y = \frac{-1}{2(4x+5)^{0.5} - 7}$

Do not isw. So if the candidate then writes $y = \frac{1}{7} - \frac{1}{2\sqrt{4x+5}}$ it is A0

Question Number	Scheme	Marks
<p>3 (a)</p> <p>(b)</p> <p>(c)</p>	<p>Attempts a correct identity $3x^3 + 8x^2 - 3x - 6 \equiv (Ax + B)x(x + 3) + C(x + 3) + Dx$ o.e. Correct method for two constants e.g. $x = 0, x = -3 \Rightarrow C = \dots, D = \dots$ Two correct constants e.g. $C = -2$ and $D = 2$ Correct method to find all four constants (e.g. by comparing coefficients) $A = 3, B = -1, C = -2, D = 2$</p> <p>$g(x) = 3x - 1 - \frac{2}{x} + \frac{2}{x+3}$ $\Rightarrow g'(x) = 3 + \frac{2}{x^2} - \frac{2}{(x+3)^2}$</p> <p>Explains that (if $x > 0$) $\frac{2}{x^2} > \frac{2}{(x+3)^2}$ so $\frac{2}{x^2} - \frac{2}{(x+3)^2} > 0$ and $\Rightarrow g'(x) > 3$</p>	<p>M1 dM1 A1 ddM1 A1</p> <p>(5)</p> <p>M1 A1ft</p> <p>(2)</p> <p>B1</p> <p>(1)</p> <p>(8 marks)</p>
<p>3 (a) ALT</p>	<p>Via division</p> <p>Attempts to divide $3x^3 + 8x^2 - 3x - 6$ by $x^2 + 3x$ forming a linear quotient Correct method for two constants implied by quotient of $3x + \dots$ Correct quotient $3x - 1$ Correct method to find all four constants (e.g. uses PF on $\frac{rem}{x(x+3)}$) $A = 3, B = -1, C = -2, D = 2$</p>	<p>M1 dM1 A1 ddM1 A1</p> <p>(5)</p>

(a)

M1: Establishes a method of starting the problem

- either by attempting a correct identity
- or attempting to divide the cubic by $x^2 + 3x$ to obtain a linear quotient

Condone slips in the cubic expression but the intention must be correct

dM1: Attempts a correct method to find two constants. An attempt must be made at a correct equation

For the main method this could be via substituting both $x = 0, x = -3 \Rightarrow C$ and D

They may set up 4 simultaneous equations and solve to find two of the constants.

FYI the equations are $A = 3, 3A + B = 8, 3B + C + D = -3$ and $3C = -6$

For division it will be arriving at a linear quotient of the form $3x \pm \dots$

A1: Achieves **any** two correct constants.

Allow $3x - 1$ as the quotient via the alt method. Condone this just written down, i.e $A = 3, B = -1$

ddM1: Attempts a full method to find all four constants.

In the main method this may be achieved by substituting both $x = 0, x = -3$ followed by comparing coefficients of x^3 and x^2 for instance. Other methods can involve substituting other values of x .

In the alternative method it is for dividing and then setting $\frac{\text{remainder}}{x(x+3)} \equiv \frac{C}{x} + \frac{D}{x+3}$

before finding values of C and D

A1: Correct values for all four constants $A = 3, B = -1, C = -2, D = 2$

Allow for these to be embedded within the identity

(b)

M1: Attempts to differentiate and achieves $\frac{C}{x} + \frac{D}{x+3} \rightarrow \frac{\dots}{x^2} + \frac{\dots}{(x+3)^2}$

A1ft: Differentiates $Ax + B + \frac{C}{x} + \frac{D}{x+3}$ to $A - \frac{C}{x^2} - \frac{D}{(x+3)^2}$ following through on their constants.

Candidates should simplify their coefficients.

You may award as above with constants A, C and D instead of the numerical values.

(c)

B1: This requires a correct part (a) and a correct (b). Look for a reason and a conclusion

Accept as a minimum $\frac{2}{x^2} - \frac{2}{(x+3)^2} > 0$ so $g'(x) > 3$

Or $\frac{2}{x^2} > \frac{2}{(x+3)^2}$ so $g'(x) > 3$

Also $3 + \frac{2}{x^2} - \frac{2}{(x+3)^2} = 3 + \frac{2(6x+9)}{x^2(x+3)^2}$ and explains that this is $3 + (+ve) > 3$

Question Number	Scheme	Marks
4(a)	$\sqrt{1-4x^2} = 1 - \frac{1}{2} \times 4x^2$ $\frac{\frac{1}{2} \times -\frac{1}{2} \times (-4x^2)^2}{2} \quad \text{or} \quad \frac{\frac{1}{2} \times -\frac{1}{2} \times -\frac{3}{2} \times (-4x^2)^3}{3!}$ $= 1 - 2x^2 - 2x^4 - 4x^6 + \dots$	B1 M1 A1, A1 (4)
(b)	Substitutes $x = \frac{1}{4}$ into both sides of (a) e.g. $\sqrt{\frac{3}{4}} \approx 1 - 2 \times \left(\frac{1}{4}\right)^2 - 2 \left(\frac{1}{4}\right)^4 - 4 \left(\frac{1}{4}\right)^6$ $\sqrt{3} \approx 1.7324$ cao	M1 A1 (2) (6 marks)

(a)

B1: Correct first two terms which does not need to be simplified, so $1 + \frac{1}{2} \times -4x^2$ is fine.

M1: Correct attempt at the binomial expansion for term 3 **or** term 4.

Look for $\frac{\frac{1}{2} \times -\frac{1}{2} \times (\pm 4x^2)^2}{2}$ or $\frac{\frac{1}{2} \times -\frac{1}{2} \times -\frac{3}{2} \times (\pm 4x^2)^3}{3!}$ but condone a failure to square or cube the 4 (i.e. missing brackets)

Also award this mark for candidates who mistakenly attempt the binomial expansion of

$\sqrt{1-4x}$ to produce either $\frac{\frac{1}{2} \times -\frac{1}{2} (\pm 4x)^2}{2}$ or $\frac{\frac{1}{2} \times -\frac{1}{2} \times -\frac{3}{2} (\pm 4x)^3}{3!}$

Or $\sqrt{1-x^2}$ to produce either $\frac{\frac{1}{2} \times -\frac{1}{2} (\pm x^2)^2}{2}$ or $\frac{\frac{1}{2} \times -\frac{1}{2} \times -\frac{3}{2} (\pm x^2)^3}{3!}$

A1: Two correct and simplified terms of $-2x^2, -2x^4, -4x^6$

A1: $1 - 2x^2 - 2x^4 - 4x^6$ or exact simplified equivalent such as $1 + (-2)x^2 + (-2)x^4 + (-4)x^6$

Ignore any additional terms. This may be given separately as a list. $1, -2x^2, -2x^4, -4x^6$

(b)

M1: Substitutes $x = \frac{1}{4}$ into both sides of (a) and achieves LHS of $\sqrt{\frac{3}{4}}$ or $\frac{\sqrt{3}}{2}$

It would be implied by $(\sqrt{3} =) 2 \times \text{their} \left(1 - 2 \times \left(\frac{1}{4}\right)^2 - 2 \left(\frac{1}{4}\right)^4 - 4 \left(\frac{1}{4}\right)^6 \right)$

A1: 1.7324 Correct answer only here. This is not awrt

Note that the calculator answer is 1.7321

Alt (a) It is possible to attempt part (a) as follows but it would be very unusual to get the terms up to x^6

$$\sqrt{1-4x^2} = (1-2x)^{\frac{1}{2}} \times (1+2x)^{\frac{1}{2}} = \left(1 - x - \frac{1}{2}x^2 - \frac{1}{2}x^3 \dots \right) \times \left(1 + x - \frac{1}{2}x^2 + \frac{1}{2}x^3 \dots \right) = 1 \dots$$

Score M1 for such an attempt and award the other marks as in the main scheme. As is the main scheme look for a correct attempt at a term 3 or 4 in either bracket followed by an attempt to multiply out

Question Number	Scheme	
5 (a)	$\frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}} = \frac{16 \sec^2 t \tan t}{2 \sec^2 t} = 8 \tan t$ <p>At $x = 3, \tan t = -1 \Rightarrow$ Gradient $= -8$</p>	M1 A1 dM1 A1 (4)
(b)	<p>Attempts to use $1 + \tan^2 t = \sec^2 t \Rightarrow 1 + \frac{(x-5)^2}{4} = \frac{y}{8}$</p> $y = 2(x-5)^2 + 8$	M1 A1 A1 (3)
(c)	8,, f,, 32	M1 A1 (2)
		(9 marks)

(a)

M1: Attempts to use the rule $\frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}}$. Condone incorrect attempts on $\frac{dy}{dt}$ and $\frac{dx}{dt}$

A1: A correct expression for $\frac{dy}{dx} = \frac{16 \sec^2 t \tan t}{2 \sec^2 t}$ or unsimplified equivalent. Note that there may be many different versions of this including ones that have used double angle formulae. Look carefully

dM1: Dependent upon the previous M. It is for

- either substituting $\tan t = -1$ into their $\frac{dy}{dx} = g(t)$ to find the gradient
- or substituting $t = -\frac{\pi}{4}$ into their $\frac{dy}{dx} = g(t)$ to find the gradient. Condone
 $t = \text{awrt } -0.785$

A1: CSO Gradient $= -8$. This cannot be awarded from differentiation of $y = 2(x-5)^2 + 8$

(b)

M1: Attempts to use $\pm 1 \pm \tan^2 t = \pm \sec^2 t$ with $\tan t$ being replaced by an expression in x and $\sec^2 t$ being replaced by an expression in y

A1: A correct unsimplified equation $1 + \frac{(x-5)^2}{4} = \frac{y}{8}$ o.e.

A1: $y = 2(x-5)^2 + 8$. $f(x) = 2(x-5)^2 + 8$ is also fine

NB 1: It is possible to use part (a), find $\frac{dy}{dx} = 4(x-5)$, and then integrate using a point such as (3, 16) to find "c"

NB2: It is possible to use points to generate $f(x)$.

For the M1 you should expect to see $f(x) = ax^2 + bx + c$, or equivalent, and the use 3 points to set up 3 simultaneous equations in a , b and c which must be then solved. At least one of three points used must be correct. Examples of possible points that can be used are $(5, 8)$, $(3, 16)$, $(5 - 2\sqrt{3}, 32)$ and $(7, 16)$

For the A1 you need to see a correct equation, e.g. $y = 2x^2 - 20x + 58$

The final A1 will be $y = 2(x-5)^2 + 8$.

If you see a solution worthy of merit and you cannot see how to award the marks then send to review.

(c)

M1: One correct end found, condoning strict inequalities.

Look for the lower value of the range to be 8 (or their c) or the higher value to be 32

A1: 8,, f ,, 32 or equivalent such as $[8, 32]$

Question Number	Scheme	Marks
6	$u = 3 + 4 \sin x \Rightarrow \frac{du}{dx} = 4 \cos x$ $\int \frac{16 \sin 2x}{(3 + 4 \sin x)^2} dx = \int \frac{32 \sin x \cos x}{(3 + 4 \sin x)^2} dx = \int \frac{2(u-3)}{u^2} du$ $= \int \frac{2}{u} - \frac{6}{u^2} du = 2 \ln u + \frac{6}{u}$ <p>Uses limits of 5 and 7 $\Rightarrow 2 \ln 7 + \frac{6}{7} - 2 \ln 5 - \frac{6}{5} = -\frac{12}{35} + \ln \frac{49}{25}$</p>	<p>B1</p> <p>M1 A1</p> <p>dM1 A1</p> <p>M1 A1</p> <p>(7 marks)</p>

B1: States or uses $\frac{du}{dx} = 4 \cos x$ o.e. This may be seen within the integrand.

M1: Attempts to write all in terms of u .

Look for
$$\int \frac{16 \sin 2x}{(3 + 4 \sin x)^2} dx = \int \frac{\dots \sin x \cos x}{(3 + 4 \sin x)^2} dx = \pm \int \frac{\dots(u \pm 3)}{u^2} du$$

It is common to lose the square on the u^2 which would be M0.

Only the penultimate mark would then be available.

A1: Correct $\int \frac{2(u-3)}{u^2} du$ o.e. Allow this to be unsimplified.

Condone a missing du this can be implied by further work.

dM1: Integrates $\int \frac{\dots(u \pm 3)}{u^2} du$ to $\dots \ln u \pm \frac{\dots}{u}$ o.e. Condone a missing du this can be implied by further work.

Note that $\int \frac{\dots(u \pm 3)}{u^2} du \rightarrow \dots \ln u^2 \pm \frac{\dots}{u}$ is acceptable

You may see attempts using parts.

$$\int \frac{1}{u^2} \times (2u - 6) du = -\frac{1}{u} \times (2u - 6) - \int -\frac{1}{u} \times 2 du = -\frac{1}{u} \times (2u - 6) + 2 \ln u$$

A1: Correct $2 \ln u + \frac{6}{u}$. Note that $\ln u^2 + \frac{6}{u}$ or $-\frac{1}{u} \times (2u - 6) + 2 \ln u$ is also completely correct

M1: Uses limits 5 and 7 within their attempted integral and subtracts. Condone poor attempts at the integration
Alternatively converts their answer in u back to x 's using the correct substitution and uses the given limits

A1: $-\frac{12}{35} + \ln \frac{49}{25}$ or equivalent such as $\ln 1.96 - \frac{12}{35}$

ISW after a correct answer.

Question Number	Scheme	Marks
<p>7 (a)</p>	<p>Co-ordinates or position vector of a point on $l = \begin{pmatrix} 4-4\lambda \\ 2-3\lambda \\ -3+5\lambda \end{pmatrix}$</p> $\overrightarrow{AX} = \begin{pmatrix} 4-4\lambda \\ 2-3\lambda \\ -3+5\lambda \end{pmatrix} - \begin{pmatrix} 9 \\ -3 \\ 2 \end{pmatrix} = \begin{pmatrix} -5-4\lambda \\ 5-3\lambda \\ -5+5\lambda \end{pmatrix}$ <p>Uses $\overrightarrow{AX} \cdot \begin{pmatrix} -4 \\ -3 \\ 5 \end{pmatrix} = 0 \Rightarrow 20+16\lambda-15+9\lambda-25+25\lambda=0 \Rightarrow \lambda = \frac{2}{5}$</p> <p>(i) Substitutes their λ into $\begin{pmatrix} 4-4\lambda \\ 2-3\lambda \\ -3+5\lambda \end{pmatrix} \Rightarrow X = \left(\frac{12}{5}, \frac{4}{5}, -1\right)$</p> <p>(ii) $\overrightarrow{AX} = -\frac{33}{5}\mathbf{i} + \frac{19}{5}\mathbf{j} - 3\mathbf{k}$</p> $\text{Shortest distance} = \sqrt{\left(-\frac{33}{5}\right)^2 + \left(\frac{19}{5}\right)^2 + (-3)^2} = \sqrt{67}$	<p>M1</p> <p>dM1 A1</p> <p>dM1 A1</p> <p>M1 A1</p> <p>(7)</p> <p>M1</p> <p>A1</p> <p>(2)</p> <p>(9 marks)</p>
<p>7 (a) ALT way</p>	<p>Co-ordinates or position vector of a point on $l = \begin{pmatrix} 4-4\lambda \\ 2-3\lambda \\ -3+5\lambda \end{pmatrix}$</p> $\overrightarrow{AX} = \begin{pmatrix} 4-4\lambda \\ 2-3\lambda \\ -3+5\lambda \end{pmatrix} - \begin{pmatrix} 9 \\ -3 \\ 2 \end{pmatrix} = \begin{pmatrix} -5-4\lambda \\ 5-3\lambda \\ -5+5\lambda \end{pmatrix}$ <p>Uses $d^2 = (-5-4\lambda)^2 + (5-3\lambda)^2 + (-5+5\lambda)^2$ which is smallest when its gradient = 0 $\Rightarrow -8(-5-4\lambda) - 6(5-3\lambda) + 10(-5+5\lambda) = 0 \Rightarrow \lambda = \frac{2}{5}$</p> <p>(Note that this could be done by completing the square)</p> <p>(i) Substitutes their λ into $\begin{pmatrix} 4-4\lambda \\ 2-3\lambda \\ -3+5\lambda \end{pmatrix} \Rightarrow X = \left(\frac{12}{5}, \frac{4}{5}, -1\right)$</p> <p>(ii) Shortest distance = $\left(-5-4 \times \frac{2}{5}\right)^2 + \left(5-3 \times \frac{2}{5}\right)^2 + \left(-5+5 \times \frac{2}{5}\right)^2 \Rightarrow d = \sqrt{67}$</p>	<p>M1</p> <p>dM1 A1</p> <p>dM1 A1</p> <p>M1 A1</p> <p>(7)</p>

(a)

M1: States or uses a general point on $l = \begin{pmatrix} 4-4\lambda \\ 2-3\lambda \\ -3+5\lambda \end{pmatrix}$ and attempt $\overrightarrow{AX} = \begin{pmatrix} 4-4\lambda \\ 2-3\lambda \\ -3+5\lambda \end{pmatrix} - \begin{pmatrix} 9 \\ -3 \\ 2 \end{pmatrix} = \begin{pmatrix} -5-4\lambda \\ 5-3\lambda \\ -5+5\lambda \end{pmatrix}$

either way around with their general point. Condone slips

dM1: Uses a correct method to find a value for λ
This could be

- via scalar products $\overrightarrow{AX} \cdot \begin{pmatrix} -4 \\ -3 \\ 5 \end{pmatrix} = 0$
- via differentiation using minimum distance of $(-5-4\lambda)^2 + (5-3\lambda)^2 + (-5+5\lambda)^2$ in this method condone slips on the differentiation

A1: $\lambda = \frac{2}{5}$

(i)

dM1: Uses their λ to find the coordinates (or position vector) of X This is dependent upon the previous M

A1: Finds coordinates for $X = \left(\frac{12}{5}, \frac{4}{5}, -1\right)$ Condone use of position vector

(ii)

M1: Uses a correct method to find distance AX or distance AX^2 using A and their X .

Award if a correct method is seen for two of the three coordinates

Usually look for an attempt at $(-5-4\lambda)^2 + (5-3\lambda)^2 + (-5+5\lambda)^2$ with their λ .

A1: $\sqrt{67}$ Note that $d = \sqrt{67}$ so $d^2 = 67$ is quite common. This is fine as d is the constant given in the question

(b)

M1: Uses a correct method to find B .

The method can be implied by two correct coordinates for their coordinates for X and A .

A1: Correct position vector for B . $-\frac{21}{5}\mathbf{i} + \frac{23}{5}\mathbf{j} - 4\mathbf{k}$. Condone use of coordinates

Note that it is possible (though unlikely) to attempt this questions via scalar product using CA and CX .

$$\text{FYI } |\overrightarrow{CX}| = |\overrightarrow{CA}| \cos \theta = \frac{\overrightarrow{CA} \cdot \overrightarrow{CX}}{|\overrightarrow{CX}|} = 2\sqrt{2}$$

$$\text{Hence } \lambda = \frac{2\sqrt{2}}{\sqrt{50}} = \frac{2}{5}$$

Question Number	Scheme	Marks
8 (a)	$\int x^2 \ln x \, dx = \frac{1}{3}x^3 \ln x - \int \frac{1}{3}x^3 \times \frac{1}{x} \, dx$ $= \frac{1}{3}x^3 \ln x - \frac{1}{9}x^3 (+c)$	dM1 A1 (3)
(b)	$\int x^2 \ln^2 x \, dx = \frac{1}{3}x^3 \ln^2 x - \int \frac{1}{3}x^3 \times 2 \ln x \times \frac{1}{x} \, dx$ $= \frac{1}{3}x^3 \ln^2 x - \frac{2}{3} \left(\frac{1}{3}x^3 \ln x - \frac{1}{9}x^3 \right)$ $\text{Volume} = \int_1^e \pi x^2 \ln^2 x \, dx = \pi \times \left[\frac{1}{3}x^3 \ln^2 x - \frac{2}{3} \left(\frac{1}{3}x^3 \ln x - \frac{1}{9}x^3 \right) \right]_1^e$ $= \frac{5}{27}\pi e^3 - \frac{2}{27}\pi$	M1 A1ft dM1 A1 (4) (7 marks)

(a) Note that no marks are available for integrating incorrect functions

M1: Attempts to integrate by parts the correct way around. Look for $\int x^2 \ln x \, dx = \dots x^3 \ln x - \int \dots x^3 \times \frac{1}{x} \, dx$ oe

dM1: And then integrates again to a form $px^3 \ln x - qx^3$ where p and q are positive constants.

A1: $\frac{1}{3}x^3 \ln x - \frac{1}{9}x^3 + c$ Condone a missing $+c$.

Candidates who go on to write $\ln x \times \frac{x^3}{3} - \frac{1}{9}x^3 = \ln \frac{x^4}{3} - \frac{1}{9}x^3$ o.e. withhold this final A1

(b)

M1: Integrates $\int x^2 \ln^2 x \, dx$ by parts, the correct way around to reach a form $\dots x^3 \ln^2 x - \dots \int x^3 \times \ln x \times \frac{1}{x} \, dx$

You may see a π or 2π in front of this expression which is fine.

A1ft: Achieves $\int x^2 \ln^2 x \, dx = \frac{1}{3}x^3 \ln^2 x - \frac{2}{3} \times$ their answer to (a).

Accept $\int \pi x^2 \ln^2 x \, dx = \frac{1}{3}\pi x^3 \ln^2 x - \frac{2}{3} \times \pi \times$ their answer to (a) or other incorrect factors such as

$$\int 2\pi x^2 \ln^2 x \, dx = \frac{2}{3}\pi x^3 \ln^2 x - \frac{4}{3} \times \pi \times \text{their answer to (a)}$$

FYI The correct answer is $\frac{1}{3}x^3 \ln^2 x - \frac{2}{3} \left(\frac{1}{3}x^3 \ln x - \frac{1}{9}x^3 \right)$

dM1: Applies the limits 1 and e to a function of the form $\pi \times \left[\alpha x^3 \ln^2 x - \beta x^3 \ln x \pm \chi x^3 \right]_1^e$

and subtracts where α, β, χ are positive constants. The π must now be seen.

A1: $\frac{5}{27}\pi e^3 - \frac{2}{27}\pi$ or exact simplified equivalent such as $\frac{\pi}{27}(5e^3 - 2)$

/

<p>9 (a)</p> <p>(b)</p>	<p>States or uses $V = \pi \times 4^2 \times h \Rightarrow \frac{dV}{dh} = 16\pi$</p> <p>States or uses $\frac{dV}{dt} = 0.6\pi - 0.15\pi h$</p> <p>Attempts to use $\frac{dV}{dt} = \frac{dV}{dh} \times \frac{dh}{dt} \Rightarrow 0.6\pi - 0.15\pi h = 16\pi \times \frac{dh}{dt}$</p> $\frac{dh}{dt} = \frac{12-3h}{320} *$ $\frac{dh}{dt} = \frac{12-3h}{320} \Rightarrow \int \frac{dh}{12-3h} = \int \frac{1}{320} dt$ $-\frac{1}{3} \ln(12-3h) = \frac{1}{320} t + c$ <p>Uses $t = 0, h = 0.5$ $-\frac{1}{3} \ln\left(\frac{21}{2}\right) = c \Rightarrow -\frac{1}{3} \ln(12-3h) = \frac{1}{320} t - \frac{1}{3} \ln\left(\frac{21}{2}\right)$</p> <p>Substitutes $h = 3.5$ $-\frac{1}{3} \ln\left(\frac{3}{2}\right) = \frac{1}{320} t - \frac{1}{3} \ln\left(\frac{21}{2}\right) \Rightarrow t = \dots$</p> <p style="text-align: center;">208 minutes cso</p>	<p>B1</p> <p>B1</p> <p>M1</p> <p>A1*</p> <p style="text-align: right;">(4)</p> <p>M1 A1</p> <p>M1 A1</p> <p>dM1</p> <p>A1</p> <p style="text-align: right;">(6)</p> <p style="text-align: right;">(10 marks)</p>

(a)

B1: States or uses $V = \pi \times 4^2 \times h \Rightarrow \frac{dV}{dh} = 16\pi$ o.e.

B1: States or uses $\frac{dV}{dt} = 0.6\pi - 0.15\pi h$

M1: Attempts to use $\frac{dV}{dt} = \frac{dV}{dh} \times \frac{dh}{dt}$ or equivalent with their $\frac{dV}{dh}$ and $\frac{dV}{dt}$

A1*: Proceeds to $\frac{dh}{dt} = \frac{12-3h}{320}$ from a correct statement with no errors seen. The main scheme is acceptable.

Note that the answer is given and there may be many "fudged" attempts.

If you see $\frac{dh}{dt} = \frac{1}{16\pi} \times (0.6\pi - 0.15\pi h) = \frac{12-3h}{320}$ or similar without any explanation or sight of $\frac{dV}{dt}$ etc you can award B1 (implied), B1 (implied). M1 (implied), A0* (not fully shown)

(b)

M1: Separates variables and integrates both sides. Look for $\pm a \ln(12 - 3h) = \pm bt + c$ or equivalent.

Note that $\pm a \ln(4 - h) = \pm bt + k$ is also correct. There is no need for a constant at this stage

$$\text{Alternatively } \frac{dt}{dh} = \frac{320}{12 - 3h} \Rightarrow t = \dots \ln(12 - 3h) + c$$

Watch for variations on this such as $t = \ln(4 - h) + k$

$$\text{A1: } -\frac{1}{3} \ln(12 - 3h) = \frac{1}{320}t + c \text{ with or without the } + c$$

M1: Uses $t = 0$, $h = 0.5$ to find c .

Condone poor integration and poor attempts to re arrange the equation for this mark.

A1: Correct equation linking h and t .

$$\text{This may be implied by an equation with } h \text{ replaced by } 0.5. \text{ E.g. } \ln(12 - 3 \times 0.5) = -\frac{3}{320}t + \ln 10.5$$

$$\text{Condone } c \text{ being a decimal (3sf) for this mark. So } \ln(12 - 3h) = -\frac{3}{320}t + 2.35 \text{ is fine}$$

dM1: Substitutes $h = 3.5$ to find t . Dependent upon previous M

$$\text{Note that } \left[-\frac{1}{3} \ln(12 - 3h) \right]_{0.5}^{3.5} = \left[\frac{1}{320}t \right]_0^T \text{ can score 3 marks at once provided they reach a value for } T$$

A1: States 207- 208 minutes with correct units following correct work.

Accept any value between and including these. Condone $\frac{320}{3} \ln 7$ **minutes**

This method is similar to

$$\left[-\frac{1}{3} \ln(12 - 3h) \right]_{0.5}^{3.5} = \left[\frac{1}{320}t \right]_0^T$$

and can score 3 marks on the final line when they subtract

Question Number	Scheme	Marks
<p>10 (a)</p> <p>(b)</p>	<p>Writes $2(4p^3 + 6p^2 + 3p) + 1$ which is odd</p> <p>Assumption:</p> <p>E.g. (a)

B1: See scheme. Requires correct reason/algebra and a statement of the expression being odd.

Allow even + even + even + 1 = odd. Allow $2p(4p^2 + 6p + 3) + 1 = \text{odd}$

(b)

M1: Sets up the contradiction AND cubes. Condone the omission of the fact that $\frac{p}{q}$ is in its simplest form for this

mark. Condone as a minimum $\sqrt[3]{2} = \frac{p}{q}$ followed by $2 = \frac{p^3}{q^3}$ o.e.

A1: States that $p^3 = 2q^3$ and concludes both that p^3 is even so therefore p is even.

Accept other equivalent statements to even such as "multiple of 2"

Condone poor explanations so long as they state that both p^3 and p are even

M1: Writes $p = 2m$ so $(2m)^3 = 2q^3$ and then attempts to find $q^3 = \dots$

A1: States that $q^3 = 4m^3$ and concludes that both q^3 is even so therefore q is even

Accept other equivalent statements to even such as "multiple of 2"

Condone poor explanations so long as they state that both q^3 and q are even

A1*: Completely correct proof and conclusion with no missing statements.

To score this final mark the statements **now** need to be the correct way around .

E.g. q^3 is even so therefore q is even

It requires $\frac{p}{q}$ to be in simplest form (or equivalent such as no common factor) in the initial assumption.
